

Manesh R. Patel, MD on behalf of the PACIFIC-AF Investigators

Disclosures

Research Grants:

PACIFIC-AF: Bayer

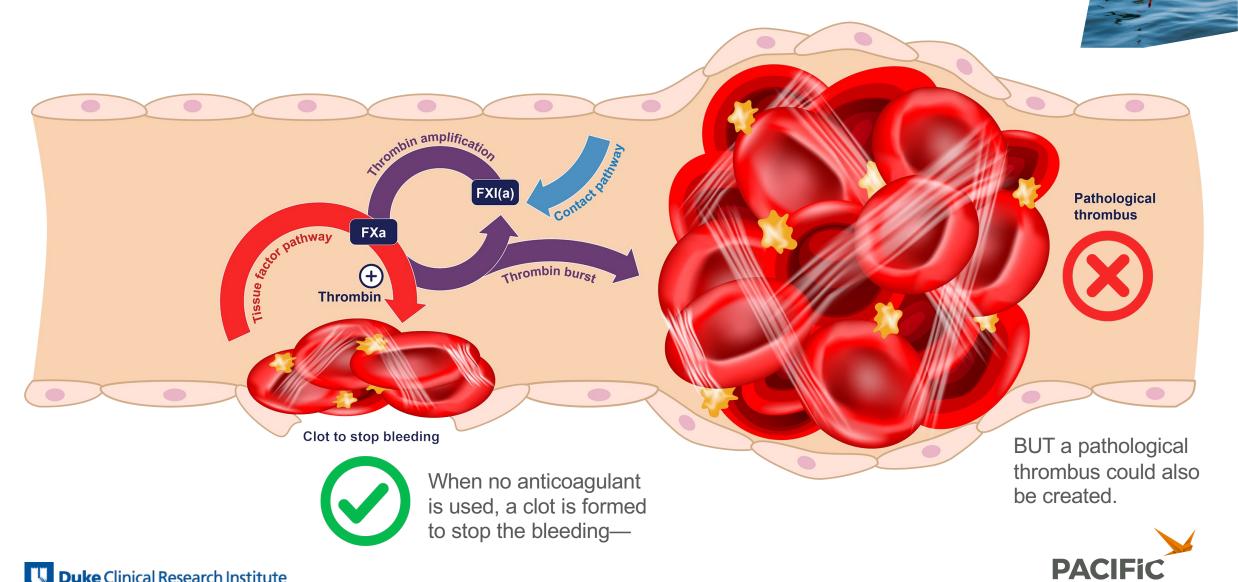

Other Research Support: Janssen, Heartflow, Idorsia, NHLBI, Novartis

Advisory Board/Consulting: Bayer, Janssen, Heartflow, Medscape

Normal Physiology: Without an Anticoagulant

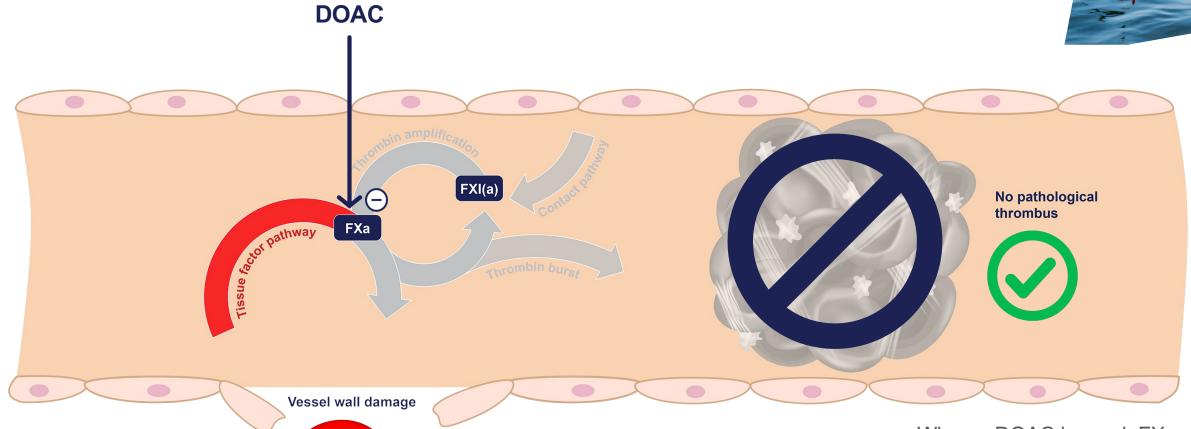

With a DOAC (e.g., apixaban or rivaroxaban)

Duke Clinical Research Institute

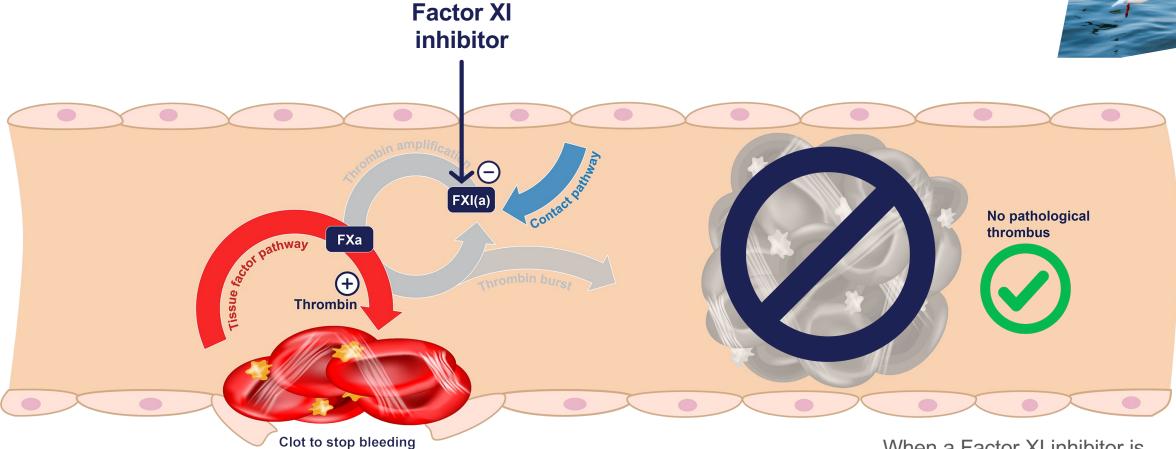

BUT can also prevent the beneficial blood clots that stop bleeding in damaged vessels.

When a DOAC is used, FXa is inhibited, which prevents pathological thrombi—

With a Factor XI Inhibitor (Hypothesis: Uncoupling Hemostasis from Thrombosis)

AND the tissue factor pathway still produces thrombin, which allows beneficial blood clots to form.

When a Factor XI inhibitor is used, thrombin amplification is inhibited, which prevents pathological thrombi—

Current Evidence Supporting FXI(a) Inhibition as a Target

CONDITION	OBSERVATION
FXI-knockout mice ¹	 Homozygous FXI-knockout mice are protected from thrombosis At the same time, they do not show a bleeding phenotype differing from wild-type mice
<i>In vivo</i> animal models ²	 Reducing/inhibiting FXI showed strong antithrombotic effects in vivo No increase in bleeding time even at very high doses or on top of dual antiplatelet therapy
Inherited FXI deficiency ³	 Individuals with FXI deficiency are reported to have a reduced incidence of VTE and stroke Hemorrhage occasionally reported after trauma or surgery (dental extractions, tonsillectomies, surgery in the urinary and genital tracts, and nasal surgery)
FXI clinical experience	 Antisense technology of IONIS⁴: Phase 2 study in TKA: Improved VTE risk reduction together with numerically less bleeding vs enoxaparin (of note, surgery was performed at suppressed FXI levels) Anti-FXI-AB (MAA868⁵ and xisomab); Anti-FXIa-AB (osocimab²): Published data from Phase 1 studies confirmed good safety and tolerability even when high levels of FXI or FXIa inhibition were maintained for more than 1 month. TKA study for osocimab completed confirming FXIa-inhibition being efficacious and well tolerated. Oral selective FXIa inhibitor (milvexian): Phase 2 work showing FXIa inhibition efficacious in prevention of VTE and associated with low risk of bleeding.⁶

- Small molecule FXIa inhibitor
 - // t_{1/2} 14.2-17.4 hours
 - // 15% Renal Elimination
- // Well-tolerated in Phase 1 trials
- // Dose-dependent FXIa inhibition
- // Does not interact with clopidogrel to affect bleeding time
- // No difference across age or sex
- // Does not inhibit or induce CYP3A4
- // Not impacted by food or pH modulating drugs

C26H21CIF4N6O4

The PACIFIC Trials: Coordinated Phase 2 Programs

- Together, will allow to assess the bleeding and efficacy profile of asundexian
- // Primary objective of PACIFIC-AF: evaluate comparative bleeding rate of asundexian vs apixaban in patients with AF
- // No assessment of efficacy possible given low event #
- // PACIFIC-AMI and PACIFIC-STROKE as placebo-controlled studies on top of antiplatelet therapy
- // PACIFIC-AF is the first Phase 2 study that will read out

Concerted evaluation across large several Phase 2 programs

Atrial fibrillation

20mg asundexian 50mg asundexian apixaban

1800 patients randomized Results later this year

PACIFIC STROKE

Non-cardioembolic ischemic stroke

10mg asundexian 20mg asundexian 50mg asundexian placebo

+ single or dual antiplatelet therapy

Acute myocardial infarction

10mg asundexian20mg asundexian50mg asundexiantherapyplacebo

1600 patients randomized Results later this year

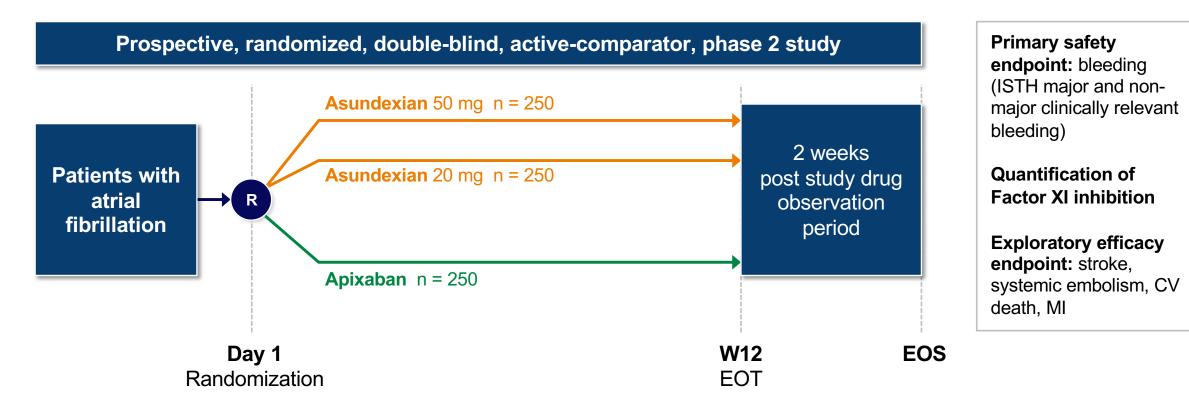

- // One coordinated IDMC
- // One blinded CEC with uniform process

Randomized, Active Comparator-Controlled, Double-Blind, Double-Dummy, Parallel Group, Dose-Finding Phase 2 Study to Compare the Safety of the Oral FXIa Inhibitor Asundexian to Apixaban in Patients with Atrial Fibrillation (PACIFIC-AF)

Primary Objective:

to evaluate that the oral FXIa inhibitor asundexian when compared to apixaban leads to a **lower incidence of bleeding** in participants with AF

AXIA: Factor XIa Inhibition Assay

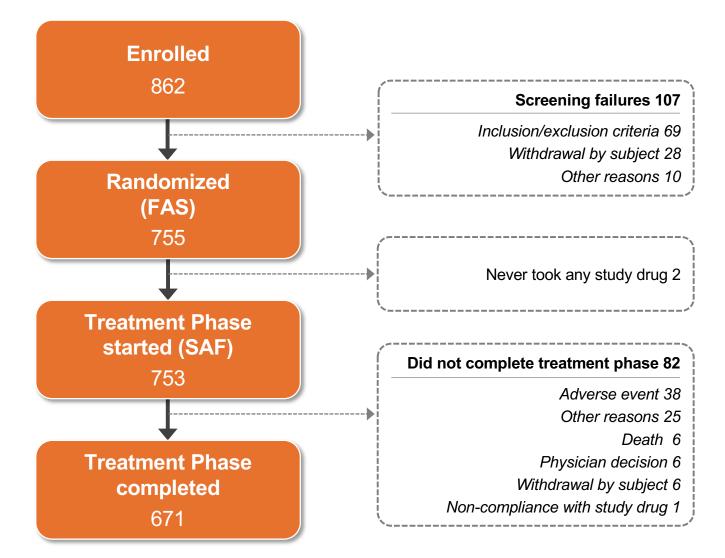

- // Proprietary assay
- // ~220 patients/ arm
- # 4 weeks on once daily drug
- // ~ trough (24-28 hours from last dose) and then again 2-4 hours afterwards
- // Quantify degree of Factor XIa inhibition

Disposition / Study Flow

Demographics and Medical History — Well Balanced Across Treatment Arms

		Asundexian 50 mg	Apixaban	Total
	N = 251	N = 254	N = 250	N = 755
Age (years) (SD)	73.6 (8.0)	73.1 (8.5)	74.3 (8.3)	73.7 (8.3)

FXIa Activity - Inhibition Data

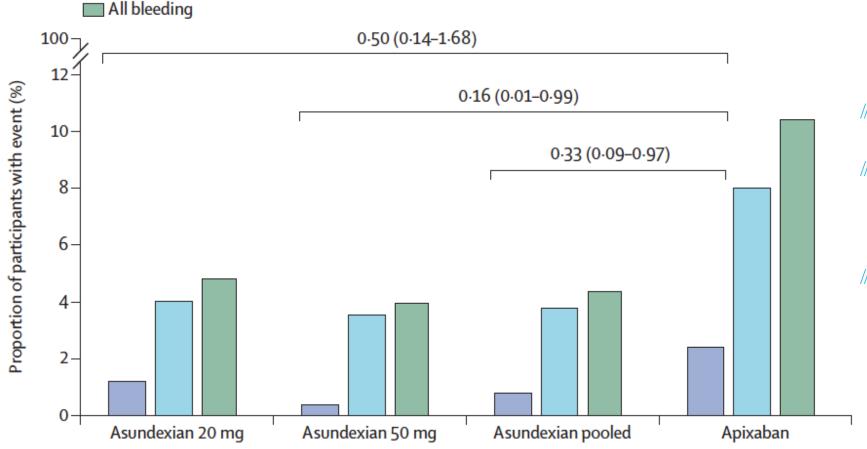

Primary Safety Outcome (ISTH bleeding classification)

On-treatment analysis, % of patients

ISTH minor bleeding

- No ISTH **major** bleeding in any treatment arm
- Less bleeding in the 2 asundexian arms reported, when compared to apixaban for different severities of bleeding
- Consistent also for BARC and TIMI bleeding definitions

Primary Safety

(Pooled) ratio of the incidence proportions for the safety outcome in the treatment emergent data scope

	Asundexian 20 mg vs. Apixaban	Asundexian 50 mg vs. Apixaban	Asundexian (pooled) vs. Apixaban
	CIR (90% CI)	CIR (90% CI)	CIR (90% CI)
ISTH major bleeding or CRNM bleeding	0.50 (0.14 - 1.68)	0.16 (0.01 - 0.99)	0.33 (0.09 - 0.97)
ISTH major bleeding	n.c.	n.c.	n.c.
CRNM bleeding	0.50 (0.14 - 1.68)	0.16 (0.01 - 0.99)	0.33 (0.09 - 0.97)
ISTH minor bleeding	0.50 (0.23 - 0.99)	0.44 (0.18 - 0.86)	0.47 (0.28 - 0.83)
All bleeding	0.46 (0.23 - 0.83)	0.38 (0.16 - 0.68)	0.42 (0.26 - 0.67)

	Asundexian 20 mg N = 249 (100%)	Asundexian 50 mg N = 254 (100%)	Apixaban N = 250 (100%)	Asundexian Total N = 503 (100%)	Total N = 753 (100%)
Any AE	118 (47.4%)	120 (47.2%)	122 (48.8%)	238 (47.3%)	360 (47.8%)
Any study drug-related AE	29 (11.6%)	26 (10.2%)	37 (14.8%)	55 (10.9%)	92 (12.2%)
Any AE leading to discontinuation of study drug	15 (6.0%)	16 (6.3%)	13 (5.2%)	31 (6.2%)	44 (5.8%)
Any study drug-related SAE	4 (1.6%)	0	0	4 (0.8%)	4 (0.5%)
AE with outcome death	1 (0.4%)	3 (1.2%)	2 (0.8%)	4 (0.8%)	6 (0.8%)

Asundexian was well tolerated in patients with AF.

A	

	Asundexian 20 mg N = 251	Asundexian 50 mg N = 254	Apixaban N = 250	Total N = 755
	IR (90% CI)	IR (90% CI)	IR (90% CI)	IR (90% CI)
CV death, MI, ischemic stroke, or systemic embolism	2 (0.80 %)	4 (1.57 %)	3 (1.20 %)	9 (1.19 %)
CV death	1 (0.40 %)	3 (1.18 %)	3 (1.20 %)	7 (0.93 %)
MI	0	1 (0.39 %)	0	1 (0.13 %)
Ischemic stroke	2 (0.80 %)	1 (0.39 %)	0	3 (0.40 %)
Systemic embolism	0	0	0	0
All cause mortality (ITT)	2 (0.80 %)	4 (1.57 %)	4 (1.60 %)	10 (1.32 %)

As expected only single efficacy endpoints were reported in the study.

→ No conclusion on efficacy can be drawn

- # First randomized active comparator (apixaban) data with small molecule Factor XIa inhibitor (asundexian)
- // Near complete inhibition of Factor XI activity with 20 and 50 mg dose asundexian
- // Only few bleeding outcome events were observed
 - // 48 participants with a bleeding event in total
- // Point estimators of risk ratios in favor of asundexian
 - // For the pooled 20 and 50 mg doses as well as for 50 mg alone the confidence intervals could exclude 1 for CRNM bleeding as well as for minor bleeding and all bleeding
 - // Overall bleeding rates lower than expected (for Apixaban: 4% assumed vs. 2.4% observed)
- // As expected no information on efficacy events: limited events with fewer than 10 events total

- # Asundexian, a small oral FXIa inhibitor was well tolerated in a Phase 2 trial of 750 patients with atrial fibrillation
- Significantly lower bleeding rates were seen for patients randomized to either dose asundexian compared to apixaban
- # Factor XI inhibition is a promising strategy to prevent pathologic thrombi while minimizing bleeding risk in AF patients — Phase 3 trial required

Safety of the oral factor XIa inhibitor asundexian compared with apixaban in patients with atrial fibrillation (PACIFIC-AF): a multicentre, randomised, double-blind, double-dummy, dose-finding phase 2 study

Next Steps:

Engaging Patients and International Communities to Perform Clinical CV Outcomes Trial

- // Net clinical benefit endpoints in upcoming OCEANIC AF trial will be informed by patient preference survey
- // AFIBOPPORTUNITIES.COM
- // Live Spring, 2022
- // Engaging investigators who want to be part
 of innovative patient-centered trials
