Disclosures

•

This presentation *will discuss off-label use* of the HeartMate 3

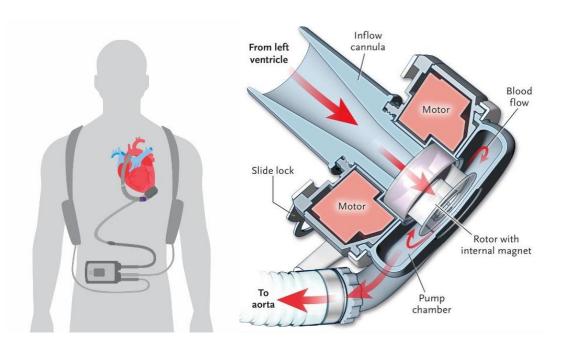

The ARIES HM3 Trial (NCT04069156) is funded and sponsored by Abbott, the manufacturer of the HeartMate 3 Left Ventricular Assist System

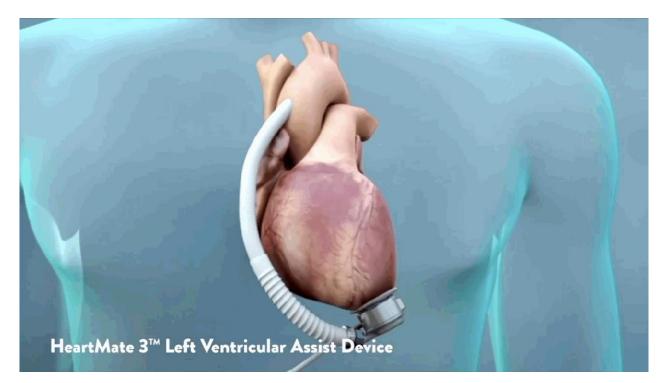

Dr Mehra reports payments made to his institution from Abbott for consulting, received personal consulting fees from Moderna, Paragonix and Natera.

He is an advisory board member for NuPulseCV, Leviticus, Transmedics and FineHeart.

ARIES

HeartMate 3 Left Ventricular Assist Device

The HeartMate 3 LVAD is a centrifugal-flow, fully magnetically levitated blood pump engineered to minimize destruction of red blood cells and thrombosis

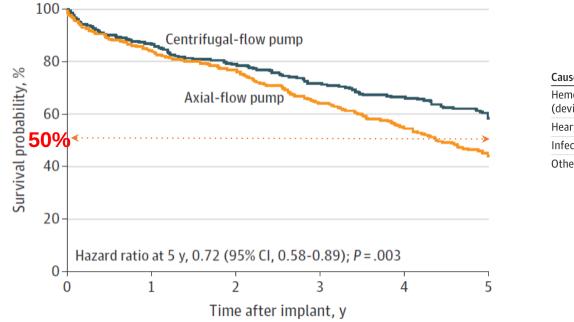

Bourque, Cotter, Dague, et al, *ASAIO J* 2016;62:375-83 Mehra, Naka, Uriel, et al, *N Engl J Med.* 2017; 376:440-450

- Wide blood-flow passages to reduce shear stress
- Frictionless with absence of mechanical bearings
- Intrinsic Pulse designed to reduce stasis and avert thrombosis

Mehra, Goldstein, Uriel, et al. N Engl J Med. 2018;378:1386-1395

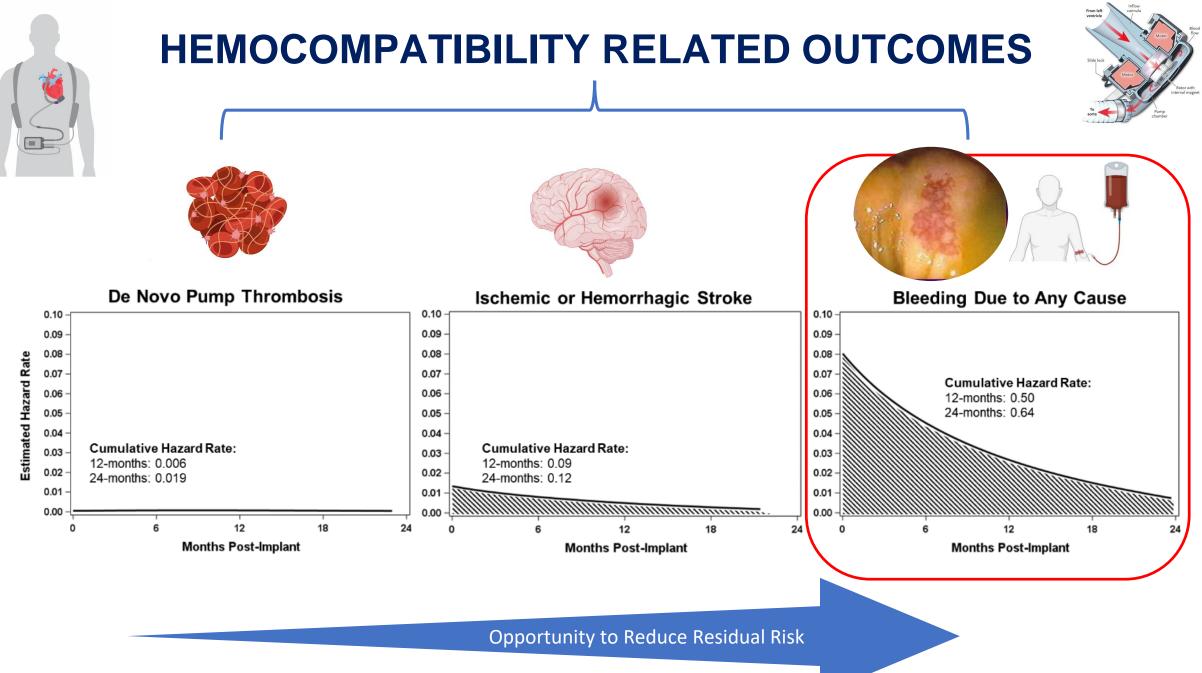

A New Survival Benchmark with LVAD Therapy

5-year survival of 58.4% with the centrifugal flow HeartMate 3 LVAD in advanced HF patients

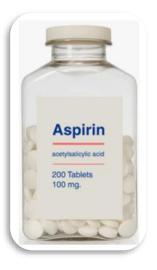

Cause of death	Difference, % (95% Cl) %ª	Hazard ratio (95% CI)	Favors centrifugal-flow pump	Favors axial-flow pump	P value ^b
Hemocompatibility-related event (device thrombosis, stroke, bleeding)	-6.8 (-10.0 to -3.6)	0.33 (0.20-0.55) -			<.001

Mehra MR, Crandall DL, Gustafsson F, et al., *Eur J Heart Fail*. 2021;23(7):1226-1237

Can aspirin be safely excluded from the antithrombotic regimen (which includes Vitamin-K Antagonists) in HM3 LVAD Patients?

Mehra MR, Crandall DL, Gustafsson F, et al., Eur J Heart Fail. 2021;23(7):1226-1237 Thomas, The Structure of Resting and Activated Platelets. Platelets 4th Ed. 2019, Pages 47-77

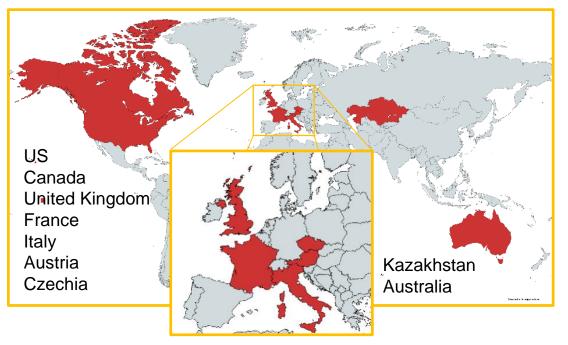

International, Multicenter, Prospective, Randomized, Double-blind, Placebo-controlled Study

HYPOTHESIS

Exclusion of aspirin from the antithrombotic regimen of HM3 LVAD patients will not adversely affect safety or efficacy of the HM3 and may reduce non-surgical bleeding

Antithrombotic Regimens Aspirin (100mg) + Standard VKA (INR 2.0-3.0) versus Placebo + Standard VKA (INR 2.0-3.0)

Global Study of 51 centers in 9 countries

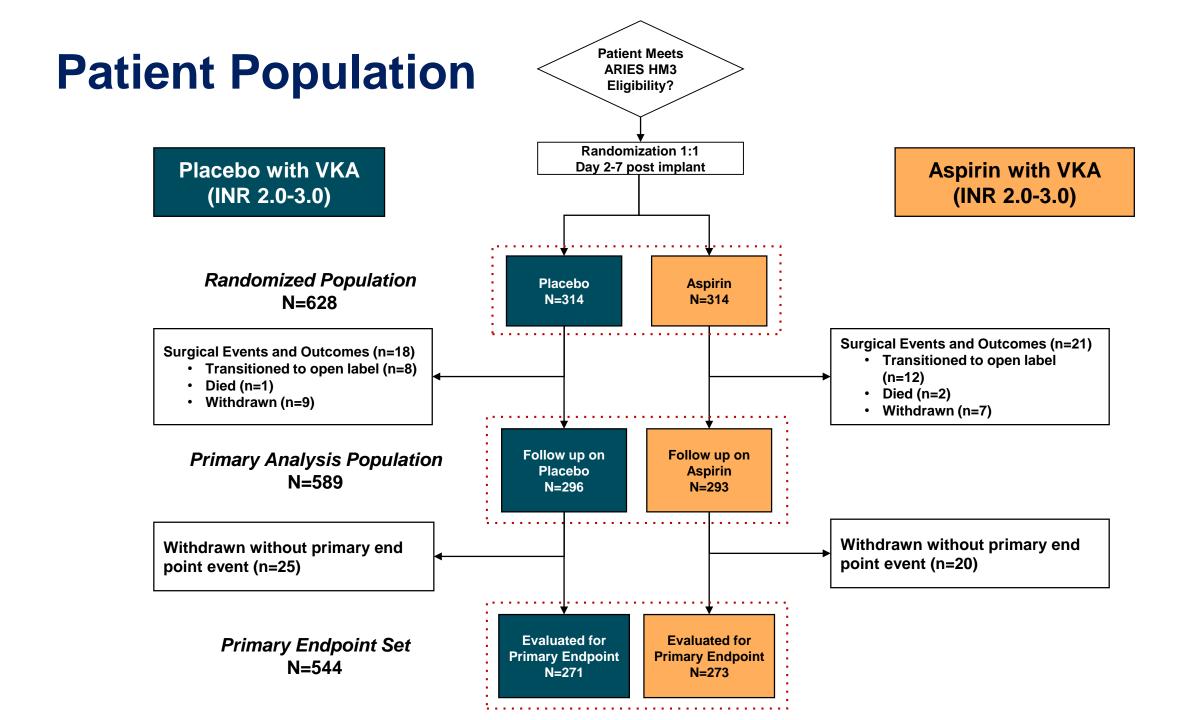

End Points

Primary: Survival free of any non-surgical^a major hemocompatibility related adverse event^b at 1-year post implant ^a >14 days post implant. ^bAny Stroke, Pump Thrombosis, Major Bleeding, and Arterial Peripheral Thromboembolism

- The final sample size provided >90% power to assess the primary end point
- Non-inferiority met if the lower boundary of the one-sided 97.5% confidence limit was greater than the non-inferiority margin (-10%)

Principal Secondary: All Non-surgical Bleeding

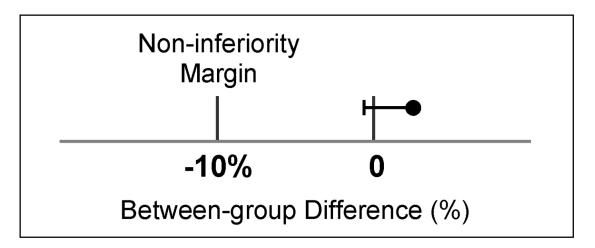

Baseline Characteristics

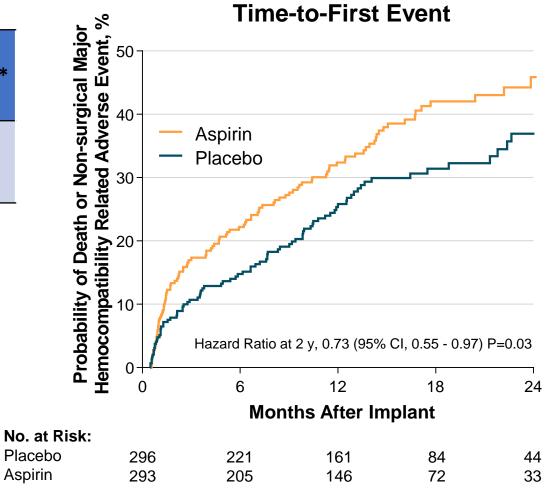

Characteristic	Placebo (N =296)	Aspirin (N =293)
Age – years, median (range)	60 (20-79)	59 (18-80)
Female sex – no. (%)	72 (24)	61 (21)
Race (white) – no. (%)*	179 (60.5)	181 (61.8)
Ischemic etiology of heart failure – no. (%)	106 (35.8)	101 (34.5)
History of atrial fibrillation – no. (%)	137 (46.3)	122 (41.6)
History of stroke – no. (%)	44 (14.9)	35 (11.9)
History of prior bleeding – no. (%)	17 (5.7)	12 (4.1)
History of diabetes mellitus – no. (%) ⁺	134 (45.3)	106 (36.2)
Destination therapy goal of pump support – no. (%)	180 (60.8)	174(59.4)
INTERMACS profile – no. (%)		
1	12 (4.1)	18 (6.1)
2	76 (25.7)	75 (25.6)
3	133 (44.9)	133 (45.4)
4-7	75 (25.3)	67 (22.7)
Enrolled in North America – no. (%)	251 (85)	248 (85)

Primary End Point Analysis

	Placebo	Aspirin	Difference (Lower 97.5% Cl)*	P-value*
Non-Inferiority Primary End Point Analysis	74.2 (201/271)	68.1 (186/273)	6.0% (-1.6%)	<.001

All sensitivity analyses concur with the primary analysis, including randomized population, worst case allocation of withdrawals, and impact of transition to open label

Principal Secondary Endpoint

Secondary Endpoints – Total Events

For every 100 patients implanted with the study LVAD, aspirin exclusion prevents 14.5 major bleeding events in the first year

Safety Endpoints

Source	Events per 100 patient-years (No. of events)					
	Placebo (n=296; 366.41 patient-years)	Aspirin (n = 293; 351.64 patient-years)	Relative risk (95% CI)	Placebo better	•	P value
Thrombotic components of the primary end point	1.6 (6)	2.8 (10)	0.58 (0.21-1.58)		_	.29
lschemic stroke ^b	1.6 (6)	2.6 (9)	0.64 (0.23-1.80)			.40
Ischemic stroke with hemorrhagic conversion ^a	0	0.3 (1)				
Any stroke	1.9(7)	3.7 (13)	0.52 (0.21-1.30)		-	.16
Debilitating stroke	0.8 (3)	0.6 (2)	1.44 (0.24-8.62)			.69
Nondebilitating stroke	1.1 (4)	3.1 (11)	0.35 (0.11-1.10)			.07
				· · · · · · · · · · · · · · · · · · ·		

0.1 1 Relative risk (95% CI) 10

Mortality

	Placebo	Aspirin
12-month Mortality	4.3%	7.2%
24-month Mortality	12.3%	9.1%

There was no difference in mortality between Placebo and Aspirin.

0.01

HR [95% CI]: 0.90 [0.50 - 1.62] P=0.71

Efficacy of Antithrombotic Therapy

Time in therapeutic range was not different between the two groups

	Placebo	Aspirin	P-Value
INR	55.1%	58.9%	0.93
Median (IQR)	(39.5-73.9)	(39.5-69.0)

Hospitalizations and Cost Savings*

*US population only, US payer perspective only

Conclusions

 In patients with advanced heart failure receiving support from a fully magnetically levitated LVAD, aspirin is not required as part of an antithrombotic regimen that includes a Vitamin K Antagonist to preserve outcomes

• Exclusion of aspirin is associated with a significant decrease in bleeding events with no increase in risk of thrombo-embolic events

• Benefits of aspirin avoidance are associated with a decrease in hospitalization rates and cost of care due to bleeding complications.
