

Bridge – TIMI 73a

Olezarsen in patients with hypertriglyceridemia at high cardiovascular risk

Brian Bergmark, MD

For the Bridge–TIMI 73a Investigators

Reducing triglyceride-rich lipoproteins (TRL) remains an unmet clinical need

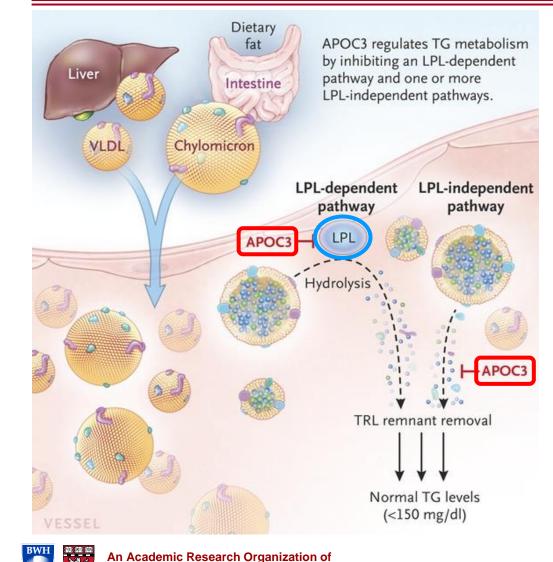

- Elevated TRLs (eg, chylomicrons and VLDL) are associated with \uparrow CV risk
- TRLs are at least as atherogenic as LDL
- Hypertriglyceridemia, particularly when severe, has direct clinical consequences

Background

Brigham and Women's Hospital and Harvard Medical School

Lipoprotein Lipase (LPL)

- Hydrolyses triglycerides
- Facilitates clearance of TRLs

Apolipoprotein C-III

- Synthesized primarily in the liver
- Resides on TRLs
- Inhibits LPL
- triglyceride levels

Loss of function mutations in APOC3

- triglyceride levels
- \downarrow CV risk

Olezarsen is a GalNAc₃-conjugated antisense oligonucleotide targeting *APOC3* mRNA

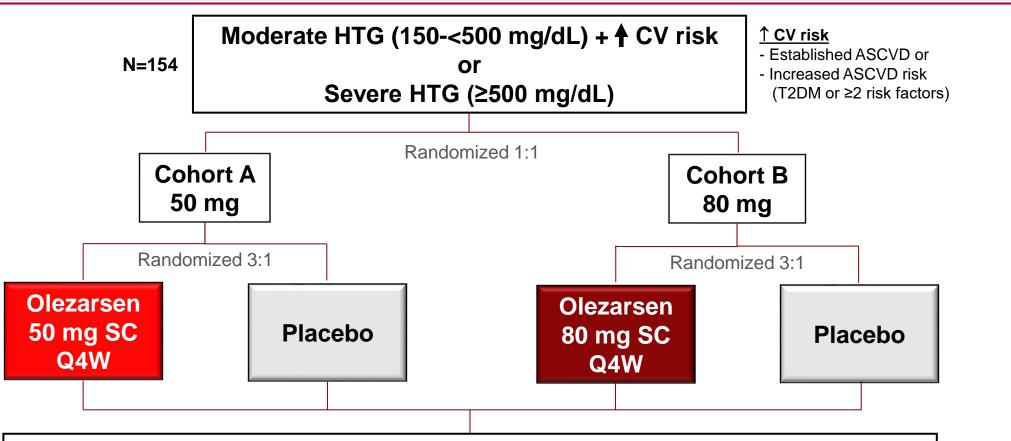

Assess the efficacy and safety of olezarsen in patients with moderate hypertriglyceridemia and elevated CV risk or with severe hypertriglyceridemia

Trial Design

Primary Endpoint: % Δ in triglycerides from baseline to 6 months Secondary Endpoints: % Δ in ApoC-III, ApoB, non-HDL-C; % Δ at 12 months Safety: ALT/AST, renal function, platelets

Trial Organization

TIMI Study Group

Marc Sabatine (Chair) Robert Giugliano (Sr Investigator) P. Fish & A. Jevne (Ops) Brian Bergmark (PI) Nicholas Marston (Investigator) S. Murphy, E. Goodrich, S. Zhang (Stats)

Sponsor: Ionis

Sotirios Tsimikas (SVP, Global CV Dev) Thomas Prohaska (Director, Clin Dev) Ewa Karwatowska-Prokopczuk (VP, CV Med) Vickie Alexander (Executive Director, Clin Dev)

Independent Data Monitoring Committee

Richard Becker (Chair) Jamie Dwyer Willis Maddrey Charles Davis (Statistician) François Mach

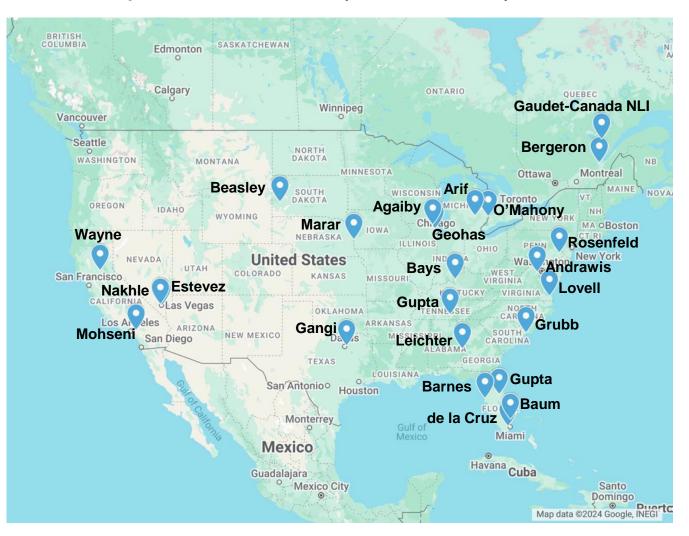

Bridge-TIMI 73a was supported by a grant from Ionis Pharmaceuticals to Brigham and Women's Hospital.

An Academic Research Organization of Brigham and Women's Hospital and Harvard Medical School

Enrollment

June – September 2022 | 24 Sites | 154 Patients

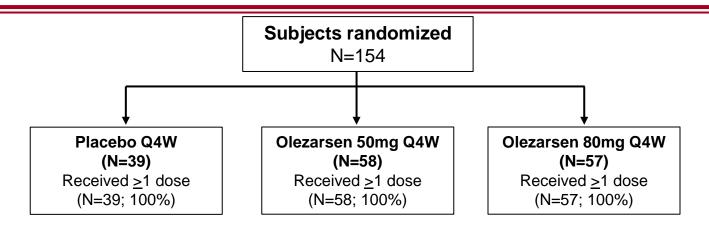

Follow-up

Permanent drug discontinuation N=24 (16%)

Died N=1 (<1%)	
Withdrawal of consent N=1 (<1%)	
Lost to follow-up N=2 (1%)	

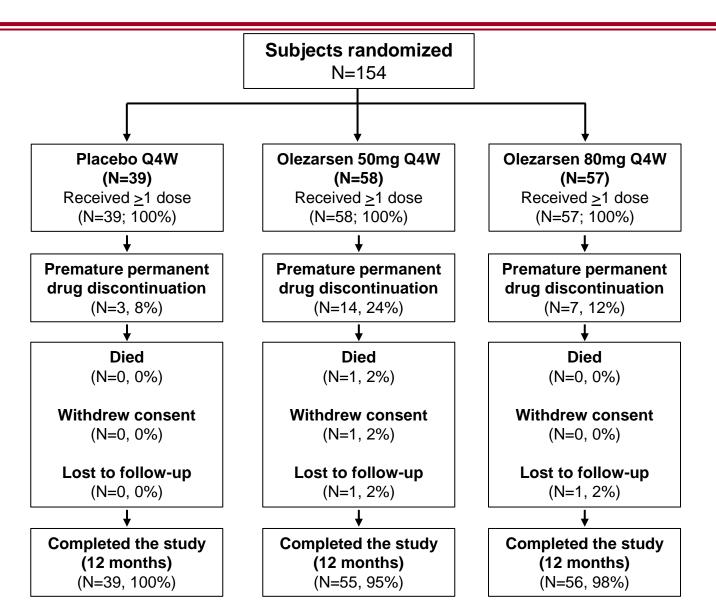

Completed the study (12 months) N=150 (97%)

Follow-up

Baseline Characteristics

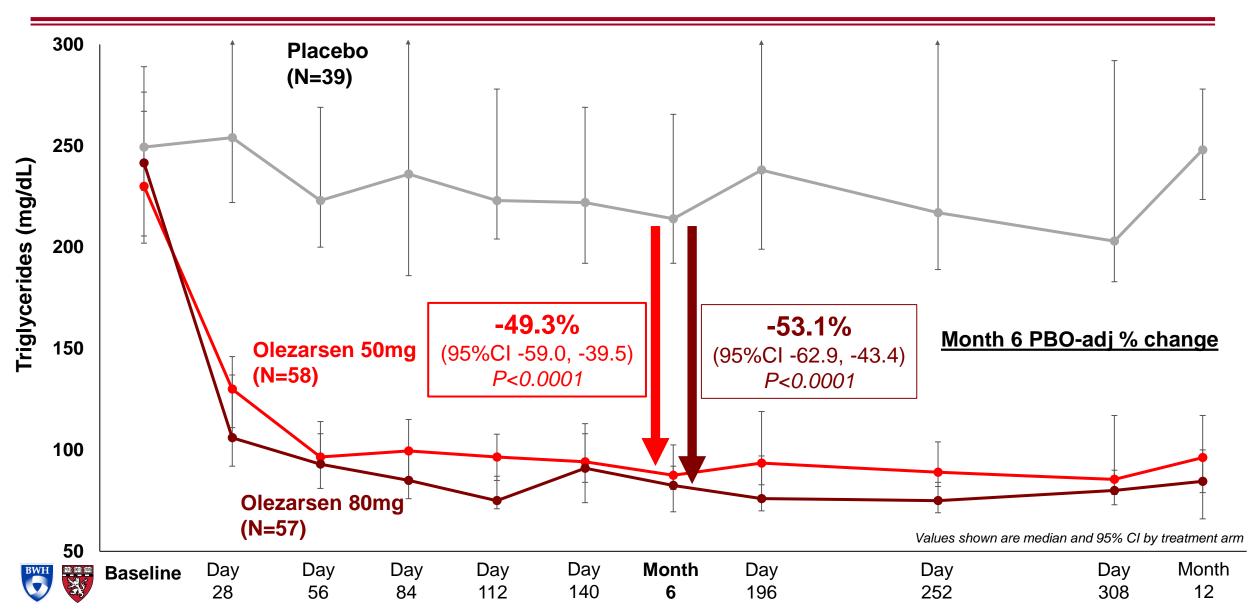

Clinical characteristics	Total Triglycerides and therap		Total N=154
Age (yrs)	62 (55-70)	Triglycerides (mg/dL)	242 (192-324)
Female sex	42%	Triglycerides ≥500 mg/dL	10%
Race		Any lipid-lowering therapy	97%
White	92%	Statin	82%
Black	8%	Ezetimibe	6%
Asian	1%	Fibrate	16%
Ethnicity		Omega-3 fatty acid	16%
Hispanic/Latino	37%	Niacin	1%
BMI (kg/m²)	33 (29-37)	PCSK9i	3%
Diabetes mellitus	68%	≥2 therapies	31%

Olezarsen Efficacy

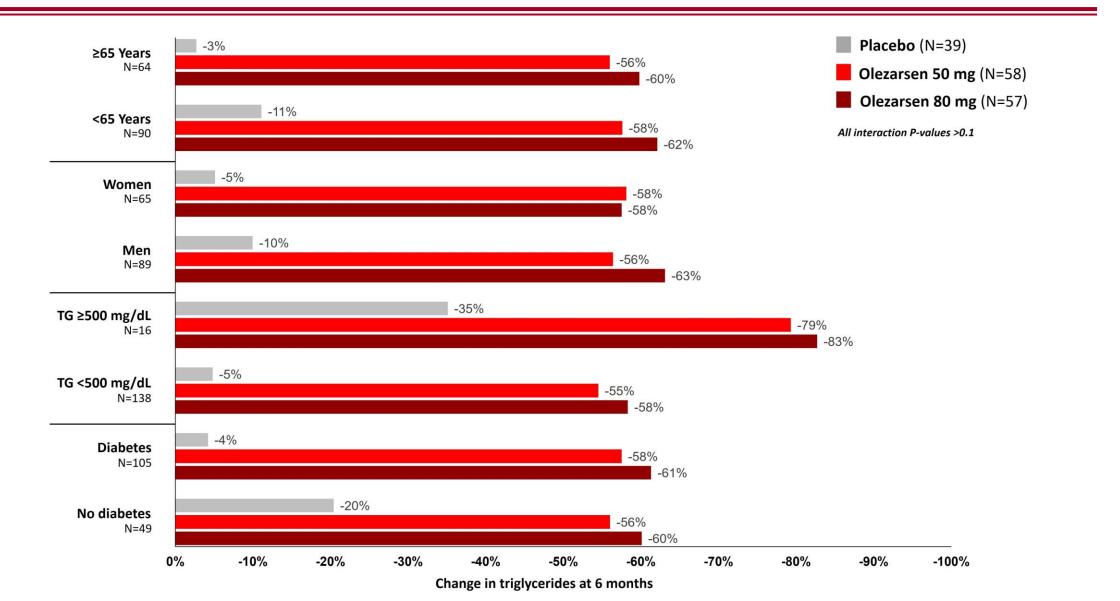

Key subgroups

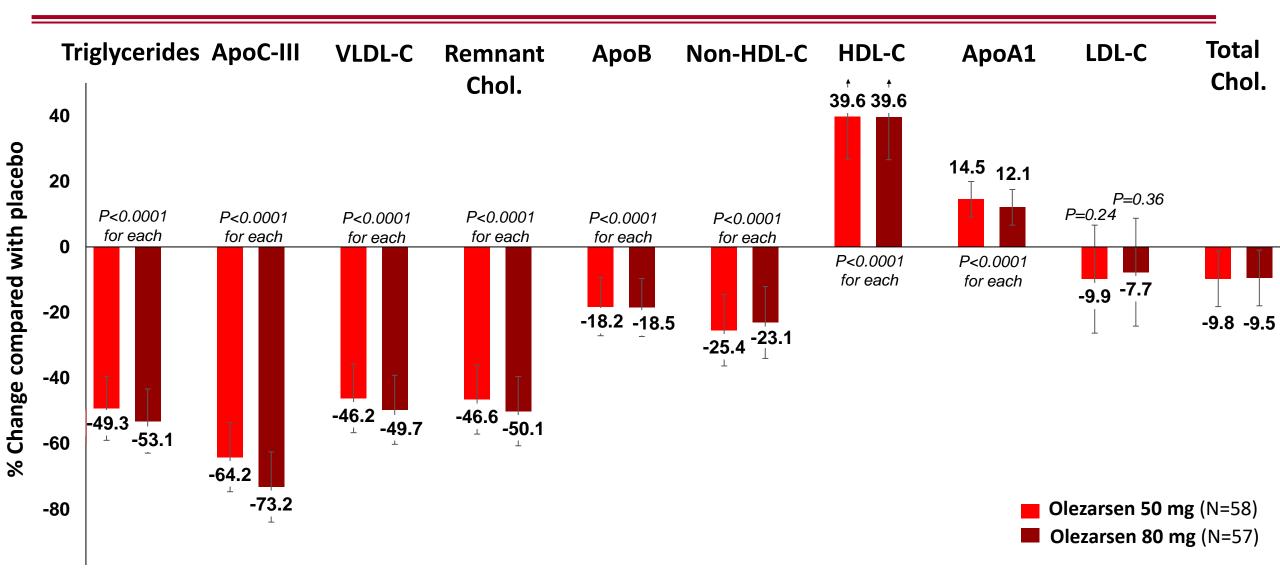

Lipid changes at 6 months

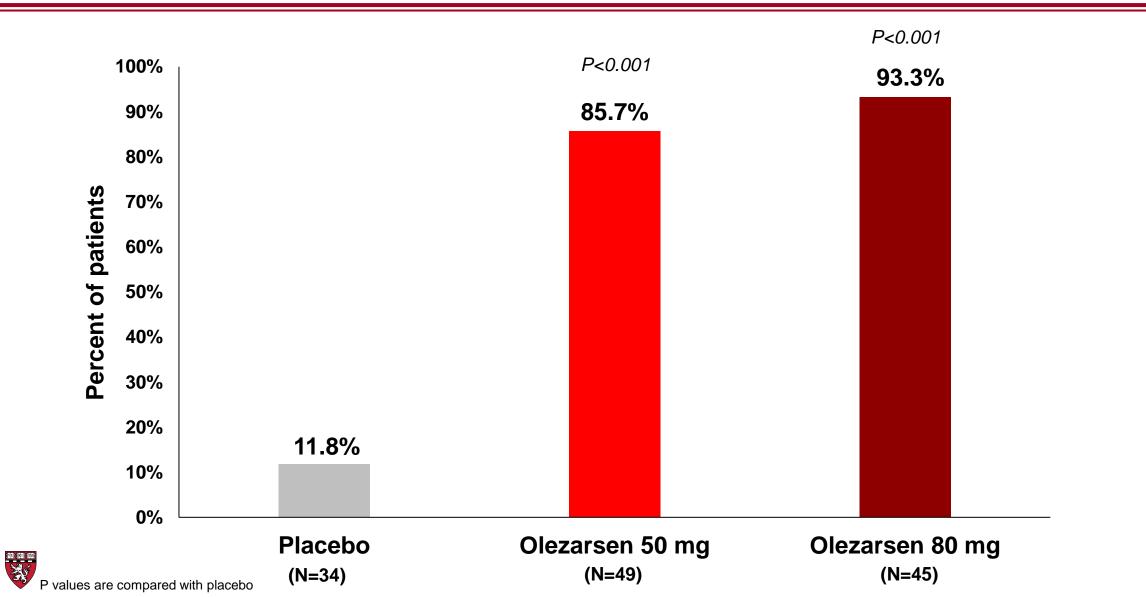

Values shown are placebo-adjusted LSM % changes and 95% CI at 6 months. P values are for comparison with placebo.

Achieved TG <150 mg/dL at 6 months

TIM

In patients with moderate hypertriglyceridemia at baseline

Key Safety Parameters

	Placebo N=39	Olezarsen 50 mg N=58	P-value vs Placebo	Olezarsen 80 mg N=57	P-value vs Placebo
Treatment-emergent adverse events					
Any	29 (74.4)	42 (72.4)	0.83	38 (66.7)	0.42
Leading to drug discontinuation	0 (0)	7 (12.1)	0.04	3 (5.3)	0.27
Serious	2 (5.1)	4 (6.9)	>0.99	7 (12.3)	0.30
Leading to drug discontinuation	0 (0)	1 (1.7)	>0.99	1 (1.8)	>0.99
Hepatic abnormalities					
ALT or AST > ULN	4 (10.3)	28 (48.3)	<0.001	26 (45.6)	<0.001
ALT or AST ≥3x ULN	0	4 (6.9)	0.15	1 (1.8)	>0.99
Total bilirubin ≥2x ULN	0	0		0	
Alkaline phosphatase ≥2x ULN	0	0		0	

Patients were eligible to enroll with ALT or AST up to 3x ULN at baseline. 2 patients (5%) in placebo, 6 patients (10%) in olezarsen 50 mg, and 4 patients (7%) in olezarsen 80 mg had an ALT level > ULN at baseline. 2 patients (5%) in placebo, 3 patients (5%) in olezarsen 50 mg, and 4 patients (7%) in olezarsen 80 mg had an AST level > ULN at baseline.

Key Safety Parameters

	Placebo N=39	Olezarsen 50 mg N=58	P-value vs Placebo	Olezarsen 80 mg N=57	P-value vs Placebo
Renal abnormalities					
eGFR decline ≥30%	8 (20.5)	6 (10.3)	0.16	4 (7.0)	0.06
eGFR decline ≥50%	0	0		0	
UPCR ≥1000 mg/g	4 (10.3)	4 (6.9)	0.71	3 (5.3)	0.44
Platelet count					
Bleeding Event	2 (5.1)	3 (5.2)	>0.99	3 (5.3)	>0.99
<140K/uL	1 (2.6)	10 (17.2)	0.05	10 (17.5)	0.03
<100K/uL	1 (2.6)	0	0.40	3 (5.3)	0.64
<75K/uL	0	0		0	
Injection site reaction	0	10 (17.2)	0.01	3 (5.3)	0.27

There were no exclusion criteria for platelet counts. 1 patient in placebo (3%), 0 patients in olezarsen 50 mg, and 2 patients (4%) in olezarsen 80 mg had a baseline platelet value below 140,000/ul.

Glycemic control

Limitations

The number of patients with severe hypertriglyceridemia was small, limiting the ability to assess olezarsen's lipid and clinical effects in these patients Trials of olezarsen in patients with severe hypertriglyceridemia are ongoing

Treatment beyond one year was not evaluated

Open-label extension programs with olezarsen are underway

These findings cannot necessarily be applied to patients with specific genetic syndromes or secondary causes of hypertriglyceridemia

Olezarsen's effects in patients with familial chylomicronemia syndrome (Balance trial) will be presented at 9:45 am today in room B313A

	<u>CORE-TIMI 72a</u>	CORE2-TIMI 72b		
	540 patientsHepatic fat MRI substudy	 390 patients Hepatic fat MRI substudy		
	Open Label Extension			
Mod HTG + CV risk	Bridge-TIMI 73a	Essence-TIMI 73b		
or Severe HTG	 154 patients 	 1312 patients Coronary CTA substudy 		

In patients with largely moderate hypertriglyceridemia and elevated cardiovascular risk, olezarsen 50 mg or 80 mg monthly reduced triglyceride levels by ~50%

- TG effect was greater than is possible with currently available treatments
- There were no major safety concerns in this phase 2b trial

Olezarsen led to meaningful reductions in apolipoprotein B and non-highdensity lipoprotein cholesterol, markers of atherogenic risk
